

**Problem with the text letter type:**

If you type a text in Geogebra, it automatically is presented as **Schreef**. See screenshot below.

To enhance the visibility of text, especially when presented on a smartboard, we skip this letter type and opt for the second option: **Schreefloos**.

Normally when you change the settings from **Schreef** to **Schreefloos**, the text changes directly to the new letter type.

Since a few weeks this is no longer the case. If you open a Geogebra-file, this transformation will only work the first time you do it. The rest of the times it simply refuses to do so.

In order to get it done for all pieces of your text in your file, you have to close your Geogebra file, reopen it, change the settings for a new text line, close the file, reopen it, change the next line and so and so forth.

Geogebra-problem

Quite annoying and very time consuming!

Can you check this out and try to make it work again like it used to be?

I work with Windows-10, normal PC, no mac book or something of that kind.

Thanks in advance,
